Exercise 1:

Q1: The IP address of gaia.cs.umass.edu 128.119.245.12.
It use port 80 to send and receive TCP segments.
The IP address of client computer is 192.168.1.102 and port is 1161

Q3: The parameters are shown below.

$$EstimatedRTT = 0.875 \times EstimatedRTT + 0.125 \times SampleRTT$$

Sequence	Sent time	ACK recv T	RTT	EstimatedRTT	Length
232129013	0.026477	0.053937	0.027460	0.027460	565

232136878	0078157	0.267802	0.189645	0.072514	1460

Q4: The lengths is shown in the above table. The first segment length is 565 and others' lengths are 1460.

Q5: The minimum amount of available buffer space is 5840 bytes. Because the buffer space is always larger than each segment. Besides, the label 'win' never decreases, which means the sender wasn't throttled.

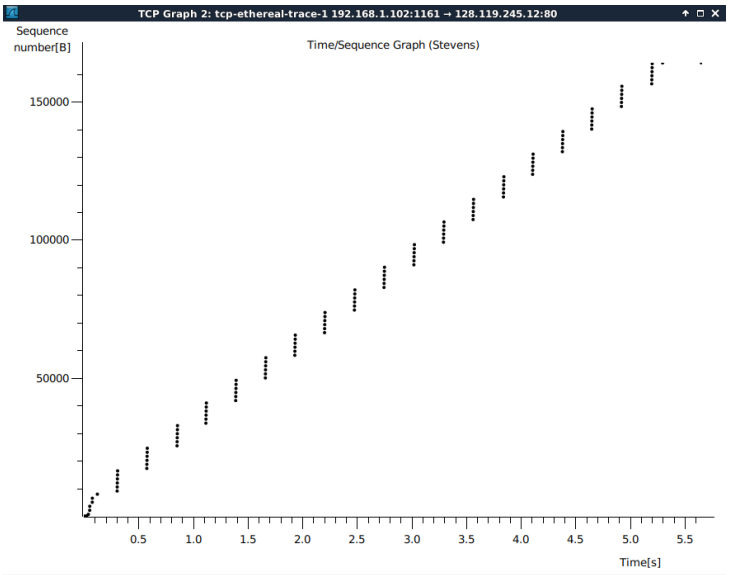
Q6: Through the time-sequence graph of TCP StreamGraph in the statistics, we can find that the sequence number is increasing along with the time. There is no duplicate sequence number. Thus, there is no retransmitted segment in the trace file.



Q7: In an ACK, 1460 bytes data would be sent.

Exercise 2:

Q1: The sequence number that is used to initiate the TCP connection is 2818463618.

No	Source IP	Destination IP	Protocol	Info
295	10.9.16.201	10.99.6.175	TCP	50045 > 5000 [SYN] Seq=2818463618 win=8192 MSS=1460

Q2: The sequence number in reply to the SYN is 1247095790, the ACK is 2818463619. Because SYN segment doesn't have data, the ACK of response is equal to the previous sequence number + 1.
Besides, it's shown in the brackets: [SYN,ACK]

296	10.99.6.175	10.9.16.201	TCP	5000 > 50045 [SYN, ACK] Seq=1247095790 Ack=2818463619 win=262144 MSS=1460

Q3: The sequence number is 2818463619 and the ACK is 1247095791.
This segment contains data, which is equal to the corresponding ACK – seq.no = 2818463652 – 2818463619 = 33 bytes.
